R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see http://rmarkdown.rstudio.com.

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this:

```
knitr::opts_chunk$set(echo = FALSE)

## Load relevant libraries
library(ggplot2)
library(dplyr)
```

```
##
## Attaching package: 'dplyr'

## The following objects are masked from 'package:stats':
##
##     filter, lag

## The following objects are masked from 'package:base':
##
##     intersect, setdiff, setequal, union
```

```
library(tinytex)

## Simulate Genetic Data for Linear Regression
### Define Parameters and Simulate Data
### Number of iterations
Iters <- 1000

### Define a matrix to store output summary statistics
mat <- matrix(rep(0, 5 * Iters), nrow = Iters, ncol = 5)

### Effect allele frequency
q <- 0.3

### Number of observations
N <- 1000
```

```r
### Complementary allele frequency
p <- 1 - q

### Effect size for heterozygotes (assume additive model for now)
B1 <- 1.25

### Effect size for another covariable
B2 <- 5

### Define allele counts from frequencies based on Hardy-Weinberg Equilibrium (HWE)
### What if we didn't round?
Nrr <- round(p^2 * N)
Nra <- round(2 * p * q * N)
Naa <- N - Nrr - Nra

### Define genotype vectors
Xrr <- rep(0, Nrr)
Xra <- rep(1, Nra)
Xaa <- rep(2, Naa)
X <- c(Xrr, Xra, Xaa)

### Define covariable vector
Z<-rbinom(N,1,.5)

## Simulate Phenotypes and Perform Linear Regression

for (i in 1:Iters) {
  ### Simulate phenotypes (change lm to glm for binary phenotypes)
  Y <- (B1 * X) + (B2 * Z) + rnorm(N, 10, 4) #note that we apply 'noise' here using arbitrary parameter

  ### Fit linear model
  model <- lm(Y ~ X)

  ### Extract p-value and effect size of X
  p <- summary(model)$coefficients[2, 4]
  B <- summary(model)$coefficients[2, 1]

  ### Store iteration number, p-value and effect size for X
  mat[i, 1] <- i
  mat[i, 2] <- p
  mat[i, 3] <- B

  ### Fit a new model with the same data, this time including independent covariable Z
  model <- lm(Y ~ X + Z)

  ### Extract p-value and effect size.
  p <- summary(model)$coefficients[2, 4]
  B <- summary(model)$coefficients[2, 1]

  ### Store the p-value and effect size for X in the other model
  mat[i, 4] <- p
  mat[i, 5] <- B
}
```

```r
### Convert matrix to data frame and name columns
mat <- as.data.frame(mat)
colnames(mat) <- c("iter", "p1", "B1","p2", "B2")

plot(mat$B1,mat$B2,main="B coefficient of variant with and without covariate")
abline(0,1)
```

```r
hist(mat$B1-mat$B2,breaks=10,col="light blue",main="difference in B")
```

```r
mean(mat$B1-mat$B2)
```

```
## [1] -0.06184044
```

```r
max(mat$B1-mat$B2)
```

```
## [1] -0.05073439
```

```r
plot(-log10(mat$p1),-log10(mat$p2),main="p value of variant with and without covariate")
abline(0,1)
```

```r
mean(mat$p1-mat$p2)
```

```
## [1] 9.61205e-05
```

```r
max(mat$p1-mat$p2)
```

```
## [1] 0.01325462
```
